NoorPath provides online Quran learning, Islamic productivity tools, and custom software that solves operational problems for schools and institutes. This proposal covers a purpose-built printing credit system.

### 1. Project Overview

We propose to develop a simple and user-friendly Printing Credit Management System for the institute. The system will allow the administrator to manage students and teachers, assign printing credits, and control printing based on the available credit balance.

The main purpose of the system is to ensure that every printed page consumes one credit and users cannot print once their allocated credits have been exhausted.

### 2. Admin Panel

The administrator will have a centralized dashboard to manage the complete system.

- Add Students
- Add Teachers
- Edit student and teacher information
- Activate or deactivate users
- Assign printing credits to students and teachers
- Add additional / recharge credits
- View remaining credits
- View used credits
- View printing history
- Monitor printing activity

### 3. Credit System

Each student or teacher will have a credit balance. Example: if a user has 100 credits and prints 1 page, 1 credit is deducted. If the user prints 5 pages, 5 credits are deducted.

### 4. Printing Restriction

Before allowing a print job, the system will check the user's available credits. If sufficient credits are available: Print Allowed → Pages Printed → Credits Deducted. If credits are exhausted, printing is blocked automatically.

The user will see a message such as: "Your printing credits have been exhausted. Please recharge your credits to continue printing." The system will not allow additional printing until credits are added to the account.

### 5. Recharge / Credit Renewal

When a student's or teacher's credits reach zero, the administrator can recharge the account by adding new credits. Example: Current Balance 0 → Admin adds +100 credits → New Balance 100 → the user can continue printing.

## 6. User Management

**Students:** Name, Student ID, Class, Section, Contact Information, Credit Balance, Account Status.

**Teachers:** Name, Teacher ID, Contact Information, Credit Balance, Account Status.

## 7. Printing History

The system will maintain a basic record of printing activity, including user name, number of pages printed, credits consumed, date and time, and printing status.

## 8. Basic Dashboard

The admin dashboard will display Total Students, Total Teachers, Total Credits Assigned, Total Credits Used, Remaining Credits, Recent Printing Activity, and Users with Zero Credits.

## 9. Basic System Flow

Admin → Add Student / Teacher → Assign Printing Credits → User Prints Document → System Counts Pages → Credits Deducted Per Page → Credits = 0 → Printing Automatically Blocked → Admin Recharges Credits → User Can Print Again.

## 10. Project Deliverables

- Admin Panel
- Student Management
- Teacher Management
- Credit Management
- Printing Credit Control
- Automatic Credit Deduction
- Printing Restriction
- Credit Recharge
- Printing History
- Basic Dashboard
- User Authentication
- Database Setup
- System Deployment

## 11. Estimated Timeline

**Estimated development time:** 3–4 weeks.

- Week 1: Database setup, authentication, admin panel, student and teacher management.
- Week 2: Credit management, credit assignment, recharge functionality, user dashboard.
- Week 3: Printing integration, page-based credit deduction, printing restrictions, printing history.
- Week 4: Testing, bug fixing, deployment, and final adjustments.

## 12. Important Note

The printing functionality will be implemented based on the institute's existing printer setup and supported printer / operating-system environment. Any third-party costs such as printer hardware, hosting, domain, SMS services, payment gateways, or other external services are not included unless specifically agreed upon.

## Credit Usage Example

| User | Assigned Credits | Pages Printed | Credits Used | Remaining |
|------|------------------|---------------|--------------|-----------|
|------|------------------|---------------|--------------|-----------|

|           |     |     |     |    |
|-----------|-----|-----|-----|----|
| Student A | 100 | 65  | 65  | 35 |
| Student B | 100 | 100 | 100 | 0  |

### Project Goal

The goal of this system is to provide the institute with a simple, reliable, and controlled printing-credit solution where every printed page consumes a credit and users are automatically prevented from printing when their available credits reach zero.

**No project cost is included in this proposal.**
